Trial undertaken by: Dr Peter Anderson (BVSc, MVS (Hons) Pasture Vet Consultant

- 1. Improvement in energy status. Blood serum concentrations of non esterified Fatty Acid (NEFA) and Triglyceride.
- 2. Evidence of reduced metabolic activity, lower levels of protein catabolism and a reduced rate of esterification.
- 3. An overall improvement in Milk volume in the treatment group.
- 4. Reduction in water content of faeces, which relate to an improvement in the intestinal epithelium tight junctions.
